

With long term sustainability in mind, Dallas Innovation Labs help build local capacity to ensure positive social impact beyond the life of a single project.

Dallas Innovation Labs act as enabling environments for technology transfer and collaboration between software developers, governments, NGOs, universities, private sector companies, local communities and experts from a variety of disciplines.

Our approach is a unique blend of the social and technological development spheres, which have traditionally worked on problem solving in isolation from each other. By working collaboratively to explore shared solutions, the iLabs fosters collaborative engineering practices, multi-disciplinary

dialogue, cross-sector partnerships and entrepreneurial innovation serving the public good.

The nations, communities, and local organizations we assist know best what their challenges and needs are, and we in turn count on their knowledge and leadership to help develop solutions that address the unique needs of each context.

Currently, we have two iLabs. One in Phnom Penh, Cambodia focusing on the Southeast Asia region and one in Buenos Aires, Argentina targeting the Latin America region.

INSTEDD TECHNOLOGIES

Toolkit

We have created an evolving platform of technology tools and services based on years of collaboration with our partners around the world. These tools are all open source, and available for anyone wanting to use them to improve the social impact and scale of their work.

Nuntium

Nuntium is a tool that allows anyone to build robust and scalable messaging applications.

Resource Map

Resource Map helps people track their work, resources and results geographically in a collaborative environment accessible from anywhere.

Pollit

Pollit helps you collect opinions, feedback and status updates from people, wherever they roam.

Riff

Riff is a tool that helps groups analyze and visualize multiple streams of information.

Remindem

Remindem helps you keep people informed of important things going on in their life and work.

Seentags

Seentags is a service that helps extract accurate information from text reports.

Mesh4x

Mesh4X is a set of libraries, services and applications that allow data to be synchronized across multiple applications, databases and files.

Reporting Wheel

The Reporting Wheel is a non-electronic device that simplifies data reporting for the most remote workers, including those with literacy challenges.

Verboice

Verboice is a highly customizable application that empowers users and developers to build their own interactive voice response systems.

No two places, problems, or cultures are exactly alike. Our goal is to find a solution that is efficient, effective and appropriate for each situation. We believe that everything can be built in smaller, useful parts, delivering value in weeks and not years. Whether you need help refining your idea, doing user-centered field design, defining a new architecture, or building software, our experience can help you achieve your goals.
